## PROGRAM LIBRARY

DECUS NO.	FOCAL8-175
TITLE	MODIFICATIONS AND SUPPLEMENT TO FOCAL8-50 RC FILTER DESIGN AND PLOT AND 3-POLE BUTTERWORTH FILTERS
AUTHOR	G. Chase
COMPANY	Portsmouth Abbey School Portsmouth, Rhode Island
DATE	January 5, 1972
SOURCE LANGUAGE	FOCAL, 1969

### ATTENTION

This is a USER program. Other than requiring that it conform to submittal and review standards, no quality control has been imposed upon this program by DECUS.

The DECUS Program Library is a clearing house only; it does not generate or test programs. No warranty, express or implied, is made by the contributor, Digital Equipment Computer Users Society or Digital Equipment Corporation as to the accuracy or functioning of the program or related material, and no responsibility is assumed by these parties in connection therewith.

MODIFICATIONS AND SUPPLEMENT TO FOCAL8-50  
RC FILTER DESIGN AND PLOT AND 3-POLE BUTTERWORTH FILTERS

DECUS Program Library Write-up

DECUS NO. FOCAL8-175

Modification of FOCAL8-50, RC Filter Design and Plot

1. The filter design program has been recoded so as to run somewhat faster.
2. The design program reinitializes after each computation, allowing the user to make several passes at a design. Previous values of input which the user does not wish to change may be retained by typing ALT MODE.
3. The input and output formats have been altered in the interests of greater clarity. The frequency variable is now named "KH" (kilohertz) in both the computation and the graphing routines.
4. The graphing routine has been slightly simplified. One bug was found and removed.

3-POLE BUTTERWORTH FILTERS - A Supplement to FOCAL8-50

Requirements: PDP-8, 4K FOCAL language with extended functions.

Function: This unambitious routine scales the normalized designs by Kerwin in Huelsman's Active Filters (McGraw-Hill, 1970) to meet the parameters of the user.

Input: R, in kilohms, C in microfarads, K (frequency) in kilohertz. The user enters any two of these, typing zero for the unknown; the routine will then calculate the missing variables.

Output: When K is the unknown, the routine prints out the value of K only. This usually occurs after one or two "passes" at a design, when the user wishes to see what available component values will give him. Otherwise all three R and all three C values are output. R(2) is always 10 times R(1) or R(3) -- the latter two are equal -- and C(2) is always 0.1 times C(1) or C(3).

Response: The comments in the main program indicate how to call up a graph of response vs. frequency.

Note: The whole program, including graph routine, fits into the user core area of FOCAL, 1969. It is not necessary to load the sections separately.

It is hoped that this might fill in the blank left by FOCAL8-50, namely the lack of any odd-pole filters. This is a much more limited routine, but has proved nonetheless useful at the author's installation.
