TECHNICAL MANUAL No. 6
EDIT—A LINE EDITOR FOR THE PDP-10
This manual has been authorized by the Director of the Prentice Computer Centre
TECHNICAL MANUAL NUMBER 6

EDIT - A LINE EDITOR FOR THE PDP-10

MNT-6/ed6
16 March 1982
ACKNOWLEDGMENTS

The author wishes to thank Mr R.D. Nilsson for his comments and suggestions made during the preparation of this manual. Mr Nilsson, Senior Lecturer in the Department of Civil Engineering, is the original author of the QEDIT program.

Version 4 resulted mainly from contributions from La Trobe and Flinders Universities. Version 5, a major revision, is the work of Mr I.S. Burgess of the Prentice Computer Centre, University of Queensland. Due acknowledgment must also be given to Mr R.A. Cook of La Trobe University for the part that IOLIB contributes to Version 5.

The sixth edition of this manual describes the functions of QEDIT version 6D(54), dated 30-Oct-1981.

CHAPTER 1

INTRODUCTION

A program written in a programming language (such as FORTRAN) is called a source program. Source programs must be input to the computer before they can be compiled (i.e. translated into the computer's machine language) and run by the computer. A program rarely runs correctly the first time and may need many corrections and modifications before it is thoroughly tested.

In a batch system a program is punched on to punch cards and these cards are input to the computer through the card reader. Program modifications are made by punching up new cards to replace those that are incorrect. The program must be input again to obtain a new compilation. The system is slightly different with terminals, however. In this case, a source program is stored as a file on the disk, the file having been created either by typing the program in via the terminal, or reading it in on punched cards. (A file is a collection of words comprising computer instructions and/or data). Corrections to the program file are carried out quickly and easily, by an editing program with which the file on disk can be altered, and there is no need to re-input the complete program from the terminal for subsequent compilations.

Data files can also be kept on the disk and edited if necessary. Files can be kept or deleted as the user wishes.

This manual is intended as a basic teaching manual for the program QEDIT. QEDIT is an editing program with a simple command structure designed to edit disk files. QEDIT is designed for use via the remote terminals on the PDP-10 and it is assumed that users are familiar with the procedures and commands necessary to operate the PDP-10 system from terminals. For the sake of clarity, the QEDIT program will be referred to as the Editor throughout this manual.

1.1 USE OF THIS MANUAL

This is a teaching manual designed to make users familiar with the use of the Editor via a terminal. It is therefore recommended that the user reads this manual while seated at a terminal and that he experiments with the facilities of the Editor as they are outlined.
INTRODUCTION

The majority of the examples given in the text will refer to the sample program created in Section 2.1, an extra copy of which is appended to this manual, Appendix A.

Appendix B gives a summary of all commands, and Appendix D gives a list of error messages. Appendix E should be studied first by those unfamiliar with the terminals. The information detailed there is useful to know. Chapter 9 shows a fully documented FORTRAN example.

1.2 LOGGING INTO THE SYSTEM

It will be assumed that the user is familiar with the technique of logging into the system. If this is not so, instructions on how to log in can be found in the User's Handbook. Once the user has successfully logged in, communication is established with the monitor which signals its readiness to accept commands by responding with a period '.'.

1.3 GENERAL FEATURES OF THE EDITOR

There are two functions of the Editor; CREATE to create a file and EDIT which enables files to be updated. Files may be data files or source program files. They must be ASCII files (i.e. the data they contain is stored as characters). The maximum size of a file which can be edited is limited by the amount of disk space available and an absolute limit of 1.3 million characters, about 2000 blocks.

The Editor creates files with variable length lines. Lines may be of any length. On input, very long lines are broken into 280 character fragments and rejoined on output. During editing, lines may be increased to a maximum of 300 characters (including the carriage return/line feed characters appended to the end of the line). To enter lines longer than the terminal width, simply continue typing, giving <cr> only at the end of the line. The carriage will return automatically to the left margin after a certain number of characters has been typed. (See "SET TTY WIDTH n" Monitor command.)

Files in the PDP-10 system are provided with a standard nomenclature. A file specification, referred to as a filespec, consists of the device or disk structure, filename and directory path. Often only the filename need be given. A filename is made up of two parts - a name and an extension.

The name consists of from 1 to 6 alphanumeric characters. The extension consists of from 1 to 3 alphanumeric characters, preceded by a period (.). The extension is usually used to denote the type of file, the most common being:

- .FOR Fortran IV source program
- .REL file for processing by relocating loader (not editable)
- .DAT Fortran data file
Additionally, switches where appropriate may be included in the file specification as /switch:value.

examples:
(i) TEST.FOR
(ii) MAIL.MAC[160,100]
(iii) ANSA:STATS.SPS[174,104]
(iv) DACCES.DAT/DIRECT:120

1.4 USE OF TAB CHARACTERS

The tab character is used to space several positions on the terminal print out. It is similar to the tab on a typewriter where a tab or 'stop' can be made at certain positions on the print line. At any point on the print line, typing the tab character will space all intervening positions until a tab is encountered. On the terminal these stops are set automatically in multiples of 8 character positions i.e. the tabs are set at positions 9, 17, 25, ... etc. (see Section E.5 on the treatment of the tab character by the Fortran compiler).

The tab character is stored on the file as a single character and is not converted to the equivalent number of blanks. For this reason, a line containing tab characters can be effectively longer than the number of characters in the line.

Some terminals have a TAB or HT key. On others, the tab character is typed by depressing the CTRL key whilst depressing I. Tab characters are denoted in this manual by <tab>.

1.5 CONTROL CHARACTERS

A carriage return character is used to indicate that this is the end of a line in the file. This character is typed on most terminals by striking the RETURN key. It is echoed by a carriage return and a line feed character. It is denoted in this manual by <cr>.

Other break characters are allowed within search or insert strings of characters, but terminate the command otherwise. <lf>, <bel>, <vt>, <ff>, <esc> and "Z" are defined as break characters. ";" is not a break character but may be used to terminate a command. The Editor can begin processing a command only after a break character is typed.

1.6 CONVENTIONS ON EXAMPLES

For the sake of clarity it is necessary to differentiate between the characters typed in by the user and the characters typed back by the Editor or the monitor. Throughout this manual, therefore, the underlined portions of examples will refer to all the output that has been typed back by the system.
CHAPTER 2
RUNNING THE EDITOR

There are two major functions of the Editor: input and edit. Input state (signalled when the Editor types back 'Input:') means that consecutive lines of input text can now be inserted in the file. Edit state is signalled by the response '*' indicating that the Editor is ready to accept editing commands.

The input state is invoked with the system command CREATE and the edit state with the system command EDIT.

2.1 CREATING A FILE

CREATE filespec /switch1/switch2....

This command is used to create a new file. A file is said to be created if no file by the same name existed when the CREATE command was given. It invokes the Editor, setting it to its input state, and storing the file name given for later use when the file created is ready to be stored on disk. If a file of the specified name already exists, the warning '%EDISEF Superseding existing file' is given. The user may then either QUIT editing immediately or at the appropriate time FILE with another filename.

Switches may include the switch form of any of the SET commands, HELP, DELSEQ and NODELSEQ, in the form /switch: value

E.g. CREATE SUMSQ.FOR/HELP:TEXT/PAGE:20/ULC

See Appendix B for a brief description of the switches available. The switch form of the SET commands may be used on a CREATE or EDIT command as described here to change the default settings. Section 8.8 shows how to use SWITCH.INI to make more permanent changes to these default settings.

Lines can be typed in when input state is signalled by the response 'Input:'. The edit state can be entered at any time by typing a null line. This is a carriage return as the first character of the line. Blank lines can be inserted by typing at least one space before typing carriage return. The FILE command (see Section 4.2) can be used to keep this created file.
2.2 EDITING A FILE

EDIT filespec /switch1/switch2....

This command is used to edit an existing file. It runs the Editor and reads the file into core setting the pointer to, and typing, the first line of the file. Edit state is signalled by the response '***'.

example:

```
.*EDIT SAMPLE.FOR<cr>
C THIS IS A SAMPLE PROGRAM
*FILE<cr>
[EDIFIL Filed : SAMPLE.FOR] [to save file and return control to the monitor]
```

EDIT may be abbreviated to ED

If the Editor has been used since the user logged in, the filespec does not have to be specified for either the CREATE or EDIT commands, as the Editor will assume the filespec and switches of the previous CREATE or EDIT command. If no filespec is specified on the first use of the Editor, the fatal error message "?CMNPC No previous command" is generated and the user returns to Monitor mode. Otherwise, if the file specified does not exist, the fatal error message "?EDIFNF LOOKUP, No file: filespec" is generated and the user returns
to Monitor mode. If no filespec is specified on a CREATE command but the Editor has been previously used, the warning "%EDISEF Superseding existing file" is given but the existing file is not overwritten until a SAVE, FILE or RUN command is given.
CHAPTER 3

COMMAND FORMATS

The Editor provides a dummy top line ***TOP and a dummy end line ***END to indicate the top and bottom of the file. These are not real entities: it is not possible, for example, to insert a line above the ***TOP line. It maintains a pointer which indicates the current line. Commands are provided to move this pointer up or down any number of lines (the farthest positions being the dummy top and the dummy end respectively); or locate it at a line containing any particular string of characters. Further commands are available for inserting, deleting or amending lines. Files may also be inserted at any point in the file.

A summary of commands is given in Appendix B. The command HELP gives a brief description of the Editor's function and commands, while H gives a list of commands with no explanation.

Many commands can be made to do an operation on a succession of lines. This is indicated by a positive or negative integer n following the command; the sign usually indicates the direction desired, i.e. (with the exception of the UP command) positive performs searches etc., down the file, negative back up the file. If n is omitted, or has the value 0 or 1, the command is performed upon one line, usually the current line. An '**' implies continuation of the specified operation to the limits of the file, in the direction indicated. Wherever +n is given in the command descriptions, legitimate entries could be: -6 +6 -6 +** -**.

The notation /string/ following the command is used to indicate a string of characters. Delimiters are necessary because blanks may be included in the character string. The string consists of all characters between the leading and trailing delimiters. A '/' or any other non-blank character (except '*', '.', '#', '-' or '+' or ';') can be used as a delimiter, provided these delimiters are in matched pairs. The end of a command (when signified by a carriage return) will cause any necessary terminating delimiters to be supplied. Numeric delimiters are not allowed when using any deleting command.

For example, the string of characters (6X, could be indicated by one of the following:

/(6X,/)
Note however that
(6X, indicates the string 6X,
,(6X, indicates the string (6X
X(6X, indicates the string (6

Commands are normally terminated by a carriage return, but more than
one command may be typed on one line by using ';' or one of the other
break characters. This has special significance when using the REPEAT
command. Note however that break characters may be included within
strings, and as such the closing delimiter must be supplied if the
command is not terminated by a carriage return.

When a filespec may be included in the command, it is indicated by the
notation 'filespec' in the description. This notation includes the
full specification of dev:filename.ext[path]/switches.

3.1 LOCATING LINES

It is necessary to be able to move the line pointer in order to
indicate where new lines are to be inserted, or which lines need
deleting or amending. Moving the pointer can be done by the following
instructions.

3.1.1 TOP and BOTTOM

    TOP
    BOTTOM

TOP locates the dummy top line and types it out.

example:
    .EDIT SAMPLE.FOR<cr>
    C THIS IS A SAMPLE PROGRAM
    *TOP<cr>
    ***TOP
    *

BOTTOM locates the last line of the file (not the dummy bottom line)
and types it out.

example:
    *BOTTOM<cr>
    END
    *

TOP and BOTTOM may be abbreviated to T and B respectively.
3.1.2 UP and NEXT

```
UP -n
NEXT +n
```

UP and NEXT move the line pointer +n lines up or down respectively. The located line is typed out.

UP -n is equivalent to NEXT n.

example:
```
*T<cr>
***TOP
*NEXT 4<cr>
     LP=6
*UP<cr>
  PRINT HEADINGS
*NEXT 6<cr>
     J=I*I
*UP 2<cr>
  CALCULATE SQUARE, PRINT NUMBER AND SQUARE
```

UP and NEXT may be abbreviated to U and N respectively. Since UP 1 and NEXT 1 are so widely used, especially short forms of these commands are provided. These are <esc> meaning UP 1 and <cr> meaning NEXT 1.

3.1.3 LOCATE

```
LOCATE +n /string/
```

LOCATE starts searching from the next line either up or down the file for a line containing the indicated string. If the current line is the bottom line or dummy end line the search starts at the beginning of the file. If the integer is negative, searching will proceed up the file.

If the current line is at the extreme of the file in the direction of searching, the search begins at the other extreme of the file.

example:
```
*B<cr>
     END
*LOCATE */HEADING/<cr>
  PRINT HEADINGS
*`
```

For this command n does not refer to the number of lines to be searched. The command attempts to locate the string n times, typing out and leaving the pointer at the nth line containing any occurrence of this character string.
examples:

(i) To locate the second time 'WRITE' occurs in the sample program:

```
*T<cr>
***TOP
*LOCATE 2 /WRITE/<cr>
30 WRITE (LP, 20) I, J
*-
```

(ii) To locate the first and fourth comment lines:

```
*T<cr>
***TOP
*LOCATE /C<tab>/<cr>
C THIS IS A SAMPLE PROGRAM
*LOCATE 3 /C<tab>/<cr>
C CALCULATE SQUARE, PRINT NUMBER AND SQUARE
*-
```

The search for a character string is terminated by the dummy end statement. Thus, if this is typed, the string was invalidly written, or does not exist, or the number of occurrences requested exceeded the true number of lines on which it occurred.

example:

```
*T<cr>
***TOP
*LOCATE /WRITE (10)/<cr>
***END
*-
```

[This is a nonexistent character string]

Since LOCATE is a search for the nth occurrence of a character string, a command such as LOCATE */string/* is invalid.

example:

```
*T<cr>
***TOP
*LOCATE */<cr>
%EDIIVS Illegal value: *
*-
```

If the string to be searched for is omitted, the previous SEARCH or LOCATE string will be used. This feature saves typing if the occurrence found was earlier than the one wanted.

LOCATE may be abbreviated to L

3.1.4 SEARCH

SEARCH +n /string/

SEARCH, like LOCATE, starts searching from the next line either up or down the file for a line containing the character string. Here n
refers to the number of lines to be searched. If the next line is at the end of the file, searching begins at the other end of the file.

If the character string can be found the command will leave the pointer at the required line and will type that line out.

example:

```
*T<cr>
***TOP
*SEARCH * /LP=6/<cr>
    LP=6
*  
```

If the character string cannot be found the message '%%EDISNF Not found' will be typed out unless the dummy end line terminates the search. The pointer will be left at the last line checked by the command and this line will be typed out.

example:

```
*T<cr>
***TOP
*SEARCH 8 /TYPE 60/<cr>
 [%%EDISNF Not Found]
 DO 30 I=1, 50
*SEARCH * /TYPE 60/<cr>
***END
*  
```

As with LOCATE, the search string may be omitted, in which case the previous SEARCH or LOCATE string will be assumed.

SEARCH may be abbreviated to S

3.1.5 LABEL and STATEMENT

```
LABEL +label+n
```

A more efficient method of locating lines is with the LABEL command. The label required is any alphanumeric string commencing in column 1. This is more efficient because only column 1 is checked for many lines.

As in LOCATE, if the current line is at the extreme of the file in the direction of searching, the search begins at the other extreme of the file.

The n in this command signifies the number of lines either before (-n) or after (+n) the labelled line. The label is not delimited.

example:

```
*B<cr>
      END
```

3-5
*LABEL -C+2<cr>       is equivalent to
   J=I*I
   *

The LABEL command is particularly suited to straight data files, or
Cobol and Macro source files, although it can be used with Fortran
source programs if the statement label begins in column 1. Of special
use for Fortran source programs is the STATEMENT command.

STATEMENT +statement+n

'statement' is the statement label of the Fortran line. It may be
anywhere in the first five columns with trailing or leading blanks.
The label is terminated by a tab or a blank. The Editor will not
allow embedded blanks even though Fortran does. Again, the use of +n
or -n allows lines to be located relative to a statement.

As in LOCATE, if the current line is at the extreme of the file in the
direction of searching, the search begins at the other extreme of the
file.

Unlike LABEL, which will check only on the characters given, a
statement number must match completely; i.e. STATEMENT 10 will not
match 100. Statements are not restricted to integer ones, and any
string to fit the five column leading and trailing blank specification
may be located.

e.xample:
   *STATEMENT -10-3<cr>
   C PRINT HEADINGS
   *

LABEL and STATEMENT may be abbreviated to LA and ST respectively.

3.1.6 LINE

LINE n

LINE is another command which will locate lines very quickly. Each
line in the file is numbered sequentially. LINE with an argument will
type out the indicated line as well as updating the line pointer to
point to that line. LINE with no argument gives the current line
number and the length of the line in characters, including the
<cr><lf>.

e.xample:
   *LINE<cr>
   Line 3, length = 18
   *LINE 12<cr>
      STOP
   *
   Line 12, length = 7
   [<tab>STOP<cr><lf> = 7 chars]
LINE can be abbreviated to LI

3.1.7 BACK

BACK +n

After a command which moves the line pointer, the BACK command may be given to move it back from whence it came and down (or up) n lines from there. Because deletion always begins with the current line, BACK after a DELETE command does not move the pointer. It is particularly useful after GET, INSERT, and PRINT commands but may be used after any command including BACK. BACK is a non-REPEATable command, allowing it to be used between a line of commands and a REPEAT command referring to it (see Section 6.5 for REPEAT).

example:

*LINE 4<cr>
   LP=6
*LOCATE /DO30/<cr>
***END
*BACK<cr>
   LP=6
*LOCATE /DO 30/<cr>
   DO 30 I=1, 50
*BACK<cr>
   LP=6
*BACK<cr>
   DO 30 I=1, 50
*

BACK may be abbreviated to BA

3.2 PRINTING LINES

3.2.1 ASCII printing

PRINT +/string/

PRINT +n

The PRINT command types out n lines of the file (in ASCII format) starting at the current line up or down the file and moving the pointer to the last line typed. PRINT * will type the complete file from the current line, typing being terminated by the dummy end line ***END.

If the SET FLAG command (Section 5.3) has been used, all control characters and lower case characters will be flagged as such on output. This setting may be temporarily reversed by appending a
period "." to the PRINT command.

example:

```
*TK<cr>
  ***TOP
*L 4 /<tab>/<cr>
  C     CALCULATE SQUARE, PRINT NUMBER AND SQUARE
*PRINT 5<cr>
  C     CALCULATE SQUARE, PRINT NUMBER AND SQUARE
          DO 30 I=1, 50
          J=J*I
30     WRITE (LP, 20) I, J
20     FORMAT (I8,I12)
*P.<cr>
  20<TAB>FORMAT (I8,I12)
```

If the current line is the last line or the dummy end line, PRINT *
does not restore control to the dummy top and type the entire file.
PRINT -n causes the printing to be done up the file, in reverse order.

PRINT, PRINT 0, PRINT 1 are all equivalent and will type out the
current line.

PRINT may be abbreviated to P

3.2.2 Octal Printing

OPRINT +n

This command is available should the user wish to inspect the octal
representation of certain characters, especially some of the non-typing
control characters.  See also the SET FLAG and PRINT. commands, which
show tabs and other control characters.

This command prints n lines up or down the file starting from the
current line, with each character output in its three character octal
representation.

Appendix C lists the octal codes for ASCII characters in the PDP-10
system.

example:

```
*P<cr>
  20     FORMAT (I8,I12)
*OPRINT<cr>
  040 062 060 011 106 117 122 115 101 124 040 050 066 130 054
  040 111 062 054 040 070 130 054 040 111 064 051 015 012
  *
```

OPRINT may be abbreviated to O
3.3 INSERTING LINES

3.3.1 Inserting One Line

INSERT line

Lines will always be inserted immediately after the current line and the pointer will be updated to point to the line inserted. The use of the dummy top and dummy bottom lines can be explained here as facilitating the insertion of lines at the beginning and end of the file. The line to be inserted will start one blank after the command. However, to facilitate the entering of Fortran lines the inserted line will start immediately after the command if the line starts with a <tab>. The insertion is performed without typing out the inserted line.

The text to be inserted may contain '; ' or any break character, being terminated by <cr> (or more specifically, the <lf> of the <cr><lf> pair). Several identical lines may be inserted by following this command by a REPEAT command, described in Section 6.5.

example:

```
*1 /STOP/<cr>
STOP
*INSERT C<tab> THIS IS THE END OF THE PROGRAM<cr>
*P 3<cr>
C THIS IS THE END OF THE PROGRAM
END
***END
```

3.3.2 Inserting One or More Lines

INSERT

This can be performed by typing the carriage return character immediately after the command INSERT. Input state is signalled when the Editor responds with 'Input:'. Any number of lines may be inserted after the current line and the line pointer is updated to point to the last line inserted. Edit state may be re-entered at any time by typing the null line. This is a carriage return as the first character of the line.

Lines longer than the nominal limit of 300 characters may be inserted, but they are broken into fragments of 280 characters or less for editing and reassembled when the file is output.

example:

```
*T<cr>
***TOP
*INSERT<cr>
```
Input:

C FORTRAN PROGRAM
C WRITTEN BY J. SMITH FEB 1970
C UNIVERSITY OF QLD. ST LUCIA
C THIS IS A SAMPLE PROGRAM
C PROGRAM CALCULATES THE SQUARES OF INTEGERS 1 TO 50
C PRINT HEADINGS
LP=6
WRITE (LP, 10)
10 FORMAT ('I NUMBER SQUARE'//)
C CALCULATE SQUARE, PRINT NUMBER AND SQUARE
DO 30 I=1, 50
J=I*I
30 WRITE (LP, 20) I, J
20 FORMAT (I8,I12)
STOP
C THIS IS THE END OF THE PROGRAM
END
***END
*

If edit state is not re-entered (by typing an extra <cr>) before typing editing commands the Editor will treat these commands as further data to be inserted into the file.

INSERT may be abbreviated to I

3.4 DELETING AND REPLACING LINES

3.4.1 Deleting Lines

DELETE +n

This command deletes n lines, either up or down the file starting at the current line.

DELETE +/-string/

This command starts deleting from the current line either up or down the file and continues deleting until the indicated string is located; the line containing the string is not deleted.

Both versions delete at least one line and the pointer is left at the
first line following the deleted section, this line being typed out. ***TOP and ***END are only indicators and so they cannot be deleted.

An attempt to delete ***TOP will result in the first line of the file being deleted instead. ***END will terminate a deletion.

example:

```
*T<cr>
***TOP
*DELETE<cr>
C WRITTEN BY J. SMITH FEB 1970
* 
```

It should be noted that if the string typed in is incorrect, or is only contained in the current line, then the command will delete the rest of the file, from, and including the current line. For this reason, numeric delimiters are not allowed in the DELETE command. When a string is used, the number of lines deleted is given by '[EDILDL Lines Deleted: n]' 

For example, some of the comment lines inserted before are to be deleted from the program.

```
*T<cr>
***TOP
*DELETE /SAMPLE/<cr>
[EDILDL Lines Deleted: 2]
C THIS IS A SAMPLE PROGRAM
*T<cr>
***TOP
*P Z<cr>
***TOP
C THIS IS A SAMPLE PROGRAM
* 
```

If the command given had been DELETE /SAMPLE/ then the entire file would have been deleted since SAMPLE is a nonexistent character string.

DELETE may be abbreviated to DEL

3.4.2 Replacing Lines

```
REPLACE line
```

The current line is replaced by the line starting one space after the command, as in the INSERT command. The line pointer is maintained at its current position. Replacement is performed by the program without typing out the replaced line.

3-11
example:

```
*L / 10<tab>/<cr>
  10 FORMAT ('1', 3X, 'NO', 5X, 'SQ')/<cr>
*REPLACE 10<tab>FORMAT ('1', 3X, 'NO', 5X, 'SQ')<cr>
```

REPLACE may be abbreviated to R

3.4.3 Deleting and Inserting Lines

Quite often the user is interested in deleting a portion of the file and replacing or inserting extra text in its place. This can be done directly with the DINSERT command. DINSERT behaves in the same manner as DELETE, only it places the Editor back into input state, ready to receive new data.

**DINSERT +/-n**

Will delete n lines from the current line, move back to the line before deletion and print it out before entering input state.

**DINSERT +/string/**

Will delete all lines up to the line containing the string, move back to the line before deletion and print it and a count of the lines deleted before entering input state.

DINSERT may be abbreviated to DIN

3.5 ALTERING LINES

3.5.1 Changing Character Strings

**CHANGE +/-n /string-1/string-2/**

**ALLCHANGE +/-n /string-1/string-2/**

CHANGE substitutes the first occurrence of string-1 encountered in the line by string-2, expanding or contracting the line as necessary. ALLCHANGE substitutes every occurrence of string-1 in the line (and not just the first one) by string-2.

The changed line is typed out. If the data string, string-1, is not found '[EDINOC No Change]' is typed back. If a change would expand the line to more than 300 characters, the message '§EDILTL No change - line too long' is given.

example:

```
*P<cr>
  10 FORMAT ('1', 3X, 'NO', 5X, 'SQ')
```
COMMAND FORMATS

*CHANGE /NUMBER/NO/<cr>
[EDINOC, No Change]
*CHANGE /NO/NUMBER/<cr>
   10 FORMAT ('1 NUMBER SQ'/)
*CHANGE /SQ/SQUARE/<cr>
   10 FORMAT ('1 NUMBER SQUARE'/)
*

These commands can be performed upon n lines either up or down the file starting at the current line. The line pointer is left at the last line checked, not the last line changed. Each changed line is typed out but the 'EDINOC' message is not given for unchanged lines.

example:
*T<cr>
   ***TOP
   *ALLCHANGE * /J/II<cr>
      II=I*I
   WRITE (LP, 20), I, II
   ***END
   *

If string-1 does not occur in any of the lines examined by the command then the dummy end line is the only line typed back.

example:
*<cr>
   ***TOP
   *CHANGE 5 /IVAL/I/<cr>
   *CHANGE /IVAL/I/<cr>
   ***END
   *

CHANGE and ALLCHANGE may be abbreviated to C and A respectively.

3.5.2 Appending and Prepending Character Strings

APPEND +n /string/

PREPEND +n /string/

These commands allow a user to attach the specified character string onto the end or beginning of the line. The action occurs on n lines of the file down or up the file, and can be used, for instance, to place trailing sequence numbers into a file.

example:
*<cr>
   END
   *PREPEND / 999<cr>
   999 END
   _APPEND /<tab>!COMMENT

3-13
APPEND and PREPEND may be abbreviated to AP and PRE respectively.

3.5.3 Splitting a Line into Two Lines

\begin{verbatim}
SPLIT +/string/
SPLIT +n
\end{verbatim}

This splits the current line at the point following the specified string or the \( n \)'th character and inserts the rest of the line after the current line (before the current line for SPLIT +/string/ or SPLIT +n). Notice that \( n \) refers to a number of characters, not a number of lines as in other commands and that tab counts as one character only.

example:

\begin{verbatim}
*STATEMENT 10<cr>
  10 FORMAT('1 NUMBER SQUARE'/)
*CHANGE /BER/BER','/<cr>
  10 FORMAT('1 NUMBER', ' SQUARE'/)
*SPLIT /BER',<cr>
  10 FORMAT('1 NUMBER',
              ' SQUARE'/)
*PRE /<tab>1 /<cr>
  1 ' SQUARE'/)
*STA 30<cr>
  30 WRITE (LP, 20) I, J
*SPLIT -3<cr>
  30 WRITE (LP, 20) I, J  
[NEXT<cr>
  30 *AP /<tab>CONTINUE/<cr>
  30 CONTINUE

SPLIT may be abbreviated to SP
\end{verbatim}

3.5.4 Concatenating Two Lines

\begin{verbatim}
CONCAT
CONCAT -
\end{verbatim}

This command allows a user to join two adjacent lines of a file. If no sign is specified, the line below the current line is moved to the end of the current line. If a minus sign is used, the line above the current line is moved to the end of the current line. Concatenation can not create lines longer than 300 characters. The message 'EDILTL
No change - line too long' indicates this.

example:

*STATEMENT -10+1<cr>               [to line after statement 10]
    1 ' SQUARE'/<cr>
*CHANGE /<tab>1 //<cr>              [remove the continuation code]
    '-' SQUARE'/<cr>
*UP<cr>                              [back to first line of pair]
  -10 FORMAT('1 NUMBER',
*CONCAT<cr>                            [append the next line]
  -10 FORMAT('1 NUMBER SQUARE' /)
*

CONCAT may be abbreviated to CO
CHAPTER 4
FILES

4.1 SAVE

SAVE filespec

This is a similar command to FILE. SAVE will save the complete file using the filespec given. If no filespec is supplied the name specified in the original CREATE or EDIT is used. The previous version of the file is renamed with a .BAK extension, and the present incore file will get the specified name. If a LOG file (see Section 6.2) is open it will be closed and restarted.

However, SAVE does not return control to the monitor. Instead, it returns the line pointer to the line that was being signified before the SAVE command and types this line out. Editing can then continue.

Frequent SAVE commands can be executed during editing. Then, if a system malfunction should occur, or the current file is inadvertently destroyed, editing can recommence from the point of the last SAVE command. Using the LOG facility and the PERFORM command, this recovery may be automated making frequent SAVEs less important. Since SAVE closes off the current log file and restarts it, the current log file contains only the commands since the last SAVE.

Use of a log file is recommended in preference to frequent SAVEs as being less expensive and more flexible.

example:

```
*L / (LP, 10) / <cr>
   WRITE (LP, 10)
*SAVE<cr>
   [EDISAV Saved : DSKD: SAMPLE.FOR]
   WRITE (LP, 10)   [will be saved as SAMPLE.FOR -
   the filespec in the original
   EDIT command]
*
```

SAVE may be abbreviated to S
4.2 FILE

FILE filespec

This command will save the file using the name given. If the filespec is not present in this command then the file is output with the name included in the original EDIT or CREATE command.

The dummy top line and dummy bottom line are not written with the rest of the file. These are simply used during the edit procedure. FILE returns control to the monitor after the file has been written, and any current LOG file is closed. If control is transferred to the monitor by any means other than through the FILE command the created or edited file may be lost if editing is not CONTINUEd; any current LOG file will be lost unless it is CLOSED or editing is continued.

example:
*FILE SAMPLE.FOR<cr>
[EDIFIL Filed : SAMPLE.FOR]

FILE may be abbreviated to F

4.3 QUIT

This command will return control to the monitor without outputting the file. As with the FILE command it clears the scratch file used by the Editor from the user's disk area and closes any log file. Exit to the monitor can be obtained by ^C but this will not clear this scratch file, and editing may be resumed by giving a CONTINUE or REENTER command.

example:
.EDIT SAMPLE.FOR/LOG;SAM.EDI<cr>
C   THIS IS A SAMPLE PROGRAM
*QUIT<cr>
[EDICLF Closed log file: SAM.EDI]

QUIT may be abbreviated to Q

4.4 EXECUTE

EXECUTE filespec

This command is exactly equivalent to FILE except that instead of returning to monitor mode, the last compile class command is performed again. Compile class commands comprise EXECUTE, COMPILE, LOAD and DEBUG. This feature is useful for rapidly re-editing and recompiling a program when an error is detected.

4-2
example:
*EXECUTE<cr>
[EDIFIL Filed: TEST.FOR]
FORTRAN: TEST.FOR
LINK: Loading
[LNKDEL DDT Execution]

EXECUTE may be abbreviated to E

4.5 RUN

RUN filespec

SET RUN filespec /RUN:filespec
SET RUNOFFSET n /RUNOFFSET:n

The RUN command has the function of EXECUTE except that if a SET RUN
command or /RUN switch has been given the program so specified is run
after the edited file is saved.

The SET commands store the name of a program and a starting address
offset respectively.

This facility is provided for those editing data files or RUNOFF files
to provide the convenience EXECUTE gives for program testing.

example:
*SET RUN SYS:RUNOFF<cr>
*RUN TEST.RNO<cr>
[ED:FIIL Filed : TEST.RNO]
*

[file as TEST.RNO]

[RUNOFF waiting for commands]

RUN may be abbreviated to RU

4.6 OUTPUT OF A FILE TO DISK

PUT +n filespec
PUT +/string/ filespec

PUTDEL +n filespec
PUTDEL +/string/ filespec

These instructions output part of the file and name it as indicated.
If PUTDEL is used instead of PUT the portion output is deleted from
the incore file as well. Output (and deletion) starts from the
current line and is terminated after n lines or when a line containing
the character string is located (this line being neither output nor
deleted).

The pointer is left at the first line after the section output and
this line is typed out. The PUT command works in the same way as the
FILE command except that only a portion of the file is saved and no
EXIT to the monitor is taken.

example:

```
.ED<cr>
C               THIS IS A SAMPLE PROGRAM
*L /DO 30<cr>
   DO 30 I=1, 50
*PUTDEL 4 RTN<cr>  *PUTDEL /STOP/ RTN<cr>
   STOP             [EDILDL Lines deleted: 4]
*
   STOP
```

The file RTN will thus consist of:

```
DO 30 I=1, 50
   II=I*I
30      WRITE (LP, 20) I, II
20      FORMAT (I8,I12)
```

while the program SAMPLE will have had these four lines deleted from
the file:

```
*T<cr>
***TOP
*P *<cr>
***TOP
C               THIS IS A SAMPLE PROGRAM
C               PROGRAM CALCULATES THE SQUARES OF INTEGERS 1 TO 50
C               PRINT HEADINGS
   LP=6
   WRITE (LP, 10)
10      FORMAT ('1 NUMBER SQUARE'/)
C               CALCULATE SQUARE, PRINT NUMBER AND SQUARE
   STOP
C               THIS IS THE END OF THE PROGRAM
   END
***END
*
```

Reverse PUTting follows from the generalization of the n in command
formats. It is doubtful whether it is a useful feature for these two
commands.

PUT may not be abbreviated; PUTDEL may be abbreviated to PUTD.

4.7 INSERTING FILES

GET filespec

This command is used to insert a complete file if it exists.
Insertion takes place after the current line and the pointer is left
at the last line inserted, this line being typed out.

For example, the file RTN is to be reinserted into its old position in the program.

```
*L 4 /C<tab>/<cr>
  C CALCULATE SQUARE, PRINT NUMBER AND SQUARE
  GET RTN <cr>
  20 FORMAT (I8,I12)
```

If the filespec specified in the GET command does not exist, '%EDIFNФ LOOKUP, No file: filespec' is typed back by the program.

example:
```
*GET FILE15<cr>
  %EDIFNФ LOOKUP, No file: FILE15
```

GET may be abbreviated to G

4.8 SHIFTING PARTS OF A FILE

The PUT, PUTDEL and GET instructions provide a useful and convenient way of shifting parts of the incore file to other positions. This procedure can be simplified by leaving out the names in the commands, the Editor then provides its own name for naming the temporary files created. The temporary file should be deleted before logout from the system.
CHAPTER 5
MODES OF OPERATION

5.1 EXTENT OF TYPEOUT

5.1.1 SET VERIFY and SET BRIEF

The normal mode of operation under the edit state is VERIFY. This causes a typeout of located and altered lines.

SET BRIEF or SET NOVERIFY

Restoration of the normal mode of operation is achieved by:

SET VERIFY or SET NOBRIEF

The PRINT commands are not affected by these commands.

example:
*SET VERIFY<cr>
*T<cr>
***TOP
*L 2/LP/<cr>
WRITE (LP, 10)
*SET BRIEF<cr>
*L /LP, 20/<cr>
*PRINT<cr>
WRITE (LP, 20) I, II

The switch form, /BRIEF, may be given after the filename in the EDIT or CREATE command to set the initial mode.

SET VERIFY and SET BRIEF may be abbreviated to SET V and SET B respectively.

5.1.2 Temporary Reversal of Typeout Mode

If the current mode of typeout is VERIFY, suppression of the usual typeout may be achieved by appending a period '.' to a particular
command. The reverse applies if the current mode is BRIEF. Obviously
this has no effect for commands which produce no typeout, such as
INSERT OR REPLACE. A period appended to the PRINT and DISPLAY
commands temporarily reverses the FLAG or NOFLAG mode of printing as
described in Section 5.3.

example:
*SET VERIFY<cr>
*T;L /LP<cr>
  _ LP=6
*L /WRITE;PRINT 2<cr>
    WRITE (LP, 10)
  _ 10 FORMAT ('1 NUMBER SQUARE'/)
*SET BRIEF<cr>
*T;L /LP<cr>
***TOP
*L /WRITE<cr>
    WRITE (LP, 10)
*

5.1.3 SET VERBOSITY

Messages have a 6 character message identifier as a prefix. Fatal
error messages are proceeded by "?", warnings by "$" and informative
messages are enclosed in square brackets.

example:
?EDIDLT Direct access line too big - FILEing discontinued
%EDIAMB Ambiguous command
[EDIFIL Filed : filespec]

Several levels of verbosity are available. The lower levels should be
used with discretion.

SET VERBOSITY HIGH  full messages
SET VERBOSITY STANDARD full messages
SET VERBOSITY FIRST  message identifier missing
SET VERBOSITY LOW  only the message identifier
SET VERBOSITY NONE only "?","$" or "[" given

Other verbosity levels (CONTIN, FIRCON and PRECON) refer to messages
continuing over several lines. At this time, there are no messages
that continue over several lines.

example:
.EDIT SAMPLE.FOR/VERBOSITY:FIRST<cr>
<THIS IS A SAMPLE PROGRAM>
*LINE 100<cr>
%No such line: 100 [the prefix EDINSL omitted]
*SET VERB H<cr>
*GET DSKD:ANZAS.TXT<cr>
%EDIIPP LOOKUP, No directory: DSKD:ANZAS.TXT
MODES OF OPERATION

*SET VERB FIRST<cr>
*CHANGE /DECEMBER/JANUARY/<cr>
[No change]
*SET VERB LOW<cr>
*DELETE -10<cr> [a space between "-" and "10"]
*EDIND
*SET VERB NONE<cr>
*C/D/J/<cr>
[I]
*

The initial setting for verbosity is STANDARD unless the /MESSAGE switch is used at LOGIN or /VERBOSITY switch is used in a QEDIT line in SWITCH.INI (see Section 8.8).

5.2 UPPER/LOWER CASE IN SEARCHES

SET ULCASE /ULCASE
SET NOULC /NOULC

Normally search strings must match exactly before success is declared, i.e. "Now" with some lower case characters does not match "NOW" in upper case. SET ULCASE relaxes this rule and allows upper/lower case to match lower/upper case in all commands where /string/ is an argument. SET NOULC reverts to the exact match requirement. See Section 8.8 for an example of setting ULCASE as the default.

example:
*LOCATE /lp/<cr>
***END
*SET ULCASE;BACK<cr>
    J=1*I
*LOCATE<cr>
      30 WRITE(LP, 20), I, J
*

SET ULCASE and SET NOULC may be abbreviated to SET U and SET NCU respectively.

5.3 PRINT-OUT OF SPECIAL CHARACTERS

SET FLAG /FLAG
SET NOFLAG /NOFLAG

SET FLAG causes lower case characters and control characters to be flagged as such in all subsequent print-out. 'X is printed for x, "B for Control-B, <FF> for form-feed, <ESC> for escape. This mode remains in effect until cancelled by SET NOFLAG. Either mode of typeout may be reversed temporarily with "PRINT." or "DISPLAY." commands.

5-3
example:
*I C<tab >This is a TEST<esc><cr>
*SET FLAG;PRINT<cr> [both commands on one line]
C<TAB>T'H'I'S 'I'S 'A TEST<esc>
*P.<cr> [period reverses FLAG mode]
  This is a TEST$
*SET NOFLAG<cr>
$

SET FLAG and SET NOFLAG may be abbreviated to SET F and SET NOF respectively.
CHAPTER 6

AUTOMATED EDITING AND RECOVERY TECHNIQUES

6.1 RECOVERY AFTER EDITING MISHAPS

Minor editing mistakes may be corrected with the DEL or RUBOUT key or by "U (Control-U) if noticed before the end of the line (see Appendix E.2). Otherwise the line may be edited to correct a wrong word or replace the whole line (see CHANGE and REPLACE). More catastrophic errors sometimes occur. For example if the string in "DELETE /string/" is mistyped, many lines may be deleted. The present editing may then be aborted - using the QUIT command. If the user had the foresight to SAVE recently, re-entering the commands typed since then would not be onerous. The following sections show how commands may be recorded so that recovery can be automated.

6.2 RECORDING THE EDIT COMMANDS AND TEXT

    SET LOG filespec    /LOG:filespec
    SET NOLOG

The LOG switch may be given on the EDIT or CREATE command, or SET LOG used when in edit state. This command closes any open log file and opens the specified file to receive all further characters, as commands or text, typed on the terminal.

The log file is check-pointed every 640 characters, so all but about ten lines should be available in the log after a system failure. Fatal errors close the log, as do QUIT, FILE, RUN and EXECUTE. SAVE closes and reopens the log file so that the current log refers to the disk copy of the file being edited.

If a command has damaged the in-core file and editing is aborted using the QUIT command, a log file will help in restoration. First edit the log file to remove the offending command and the QUIT command. Then EDIT the original file and PERFORM the log file.

The default filespec is nnnED1.EDI, where nnn is the job number. It is useful in preventing conflicts where more than one person may use
your project-programmer number, to use the default filespec, especially if the LOG switch is included in SWITCH.INI (see Section 8.8). Notice that the PERFORM command uses the same default.

example:

```plaintext
.EDIT SAMPLE.FOR/LOG:SAM<cr>
C   THIS IS A SAMPLE PROGRAM
*SET LOG S<cr>
 [EDICLF Closed log file: SAM]
*SET NOLOG<cr>
 [EDICLF Closed log file: S]
*
```

SET LOG and SET NOLOG may be abbreviated to SET L and SET NOL respectively.

6.3 PERFORMING A FILE OF COMMANDS

Where a sequence of editing commands is to be performed more than once, it may be convenient to create a file of those commands and PERFORM them.

PERFORM n filespec

PERFORM takes commands from the specified file, reusing the file n times. "PERFORM *" is not allowed. PERFORM finds useful application in recovering from editing errors and system failures, where a log file provides the commands to be performed.

The progress of the PERFORM can be followed since each command executed within the PERFORM is output to the terminal preceded by a plus (+) sign, and followed by any output generated. If textual output is not required, the PERFORM command may be preceded by a SET BRIEF command. For safety, any warnings given while performing, abort the PERFORM. The command may also be safely aborted by the user typing "C'C REENTER.

PERFORM is not REPEATable (see Section 6.5), but the file performed may contain both REPEAT and PERFORM commands.

The default filespec is nnnEDI.EDI, where nnn is the job number.

example:

```plaintext
*TOP;SET LOG DOTS<cr>
***TOP
*LOCATE. /<cr>
*APPEND ./<cr>
C   THIS IS A SAMPLE PROGRAM.
*SET NOLOG<cr>
 [EDICLF Closed log file: DOTS]
*PERFORM 3 DOTS<cr>
+LOCATE. /<cr>
```

6-2
+APPEND ./C PROGRAM CALCULATES THE SQUARES OF INTEGERS 1 TO 50.
+SET NOLOG [NOTE: this command exists in the log file]
+LOCATE ./<tab>/
+APPEND ./C PRINT HEADINGS.
+SET NOLOG
+LOCATE ./<tab>/
+APPEND ./C CALCULATE SQUARE, PRINT NUMBER AND SQUARE.
+SET NOLOG
+
+
PERFORM may be abbreviated to PER

6.4 MAKING A FILE OF COMMANDS

MACRO filespec

If during an editing session a file of commands is required, this may be created in one of several ways. One of the most convenient is by use of the MACRO command. The Editor goes into MACRO input state, creating the specified file from the lines which follow. Any text may be inserted into the file, the syntax being checked when the file is PERFORMed. Return to edit state is accomplished as usual by typing an extra <cr>. The macro file is then closed as signified by the message "[EDICMF Closed macro command file: filespec]". No change is made to the file being edited by this command.

The default filespec is nnnEDI.EDI, where nnn is the job number.

eample:
*MACRO DEDOT<cr>
MACRO input:
LOCATE ./<tab>/<cr>
CHANGE ././<cr>
<cr>
[EDICMF Closed macro command file: DEDOT]
*TOP; SET BRIEF<cr>
***TOP
*PERFORM 4 DEDOT<cr> [output not shown here]

MACRO may be abbreviated to M

6.5 REPEATING COMMANDS

REPEAT n RR n

This command repeats the previous command or line of commands n times. RR is simply an alternative to REPEAT which is quicker to type. This function is achieved by the Editor's remembering each line of commands in case a REPEAT is requested. Such a line is terminated by <cr> or <lf> or REPEAT. Note that <esc> and ";" do not terminate the "line of

6-3
commands" and either may be used as command separators to build up a
group of commands. Certain commands are not repeatable and are not
remembered in this way. BACK, REPEAT, SAVE and the SET commands are
non-repeatable commands which may be used between the command line and
the REPEAT command referring to it. Commands which invoke the input
state - INSERT (multi-line), DINSERT and MACRO - leave nothing to be
repeated, and neither does PERFORM.

There is a limit to the number of commands which may be stored for
repeating. This limit is the number of commands that can be stored in
one 300 character line using the shortest allowable abbreviations.
Further commands may still be typed and are acted on as usual, but the
bell is sounded to warn that the REPEAT command would act on only the
first 300 characters. The MACRO and PERFORM commands have essentially
no limit, so these should be used where the command line length may be
restrictive.

example:
  *TOP<cr>
  ***TOP
  *L /<tab>/;SP /<tab>/;U;C /<tab>/; ;SP 6;DEL -1;CO.<cr>
  C THIS IS A SAMPLE PROGRAM [L /<tab>/;]
  [SP /<tab>/;]
  THIS IS A SAMPLE PROGRAM
  C
  C

  C [delete any excess spaces]
  [C /<tab>/ /;]
  [SP 6;]

  C
  *SET BRJEF<cr>
  *REPEAT *<cr>
  C PROGRAM CALCULATES THE SQUARES OF INTEGERS 1 TO 50
  C PRINT HEADINGS
  LP=6
  WRITE (LP, 10)
  10 FORMAT ('1 NUMBER SQUARE')
  C CALCULATE SQUARE, PRINT NUMBER AND SQUARE
  STOP
  C THIS IS THE END OF THE PROGRAM
  END
  ***END
  *

REPEAT may be abbreviated to REPE, or the equivalent command, RR may
be used.
CHAPTER 7

JOB INFORMATION COMMANDS

7.1 JOB COST BALANCE (University of Queensland version only)

JOBBALANCE

The JOBBALANCE command types out the current job balance in dollars and cents.

At the start of a job the user imposes a cost limit on the job by means of the COST argument in the LOGIN command. He can change this limit by means of the SET COST command. However, if at any stage during a job the limit is exceeded the current task is terminated and output data could be lost. JOBBALANCE permits a user to enquire into the state of his job balance while still running the Editor. If the balance is nearing its limit he can Control-C out of his editing, issue a SET COST command and then CONTINUE.

example:

*JOBBAL<cr>
Balance of cost limit = $9.98
*

JOBBALANCE may be abbreviated to JOBB

7.2 JOB TIME

JOBTIME

The JOBTIME command types out the total central processor time used since the user logged in. The result is in hh:mm:ss.s

example:

*JOBTIM<cr>
Processor time = 00:00:03.40
*

JOBTIME may be abbreviated to JOBT

7-1
CHAPTER 8

SPECIALIZED COMMANDS AND OTHER FEATURES

There are a number of other commands available for performing specializing functions, e.g. depending on the type of terminal being used, or the requirements for the file being created.

8.1 SPECIAL TERMINAL COMMANDS AND OTHER FEATURES

8.1.1 Lower Case Terminals

The Editor will accept commands typed in lower case characters. The SET ULCASE command or /ULCASE switch facilitates editing mixed case files by allowing searches to succeed for either case. See Section 5.2.

The SET FLAG command or /FLAG switch could be of assistance in editing these files on a terminal which does not have lower case.

8.1.2 Display Terminals

DISPLAY +n
DISPLAY +/string/

SET PAGE n /PAGE:n
SET NOPAGE /NOPAGE

The command DISPLAY is designed for output of sections of files on display terminals. The command is the same as PRINT except that the program waits when the bottom of a page is reached and erases the screen and starts a new page when signalled. The page size is set at a default of 19, but can be set by the command SET PAGE n or /PAGE:n on the CREATE or EDIT command. As with PRINT, DISPLAY may be used to temporarily override the SET FLAG/SET NOFLAG condition (Section 5.3).

The DISPLAY command action is:

(a) outputs a hardware form feed to erase the screen

(b) outputs lines until
(i) the n'th line or the line containing 'string' is displayed,
(ii) the page 'n' is satisfied, or
(iii) a form feed is reached.

If it is (i) then a new command can be entered to the Editor. If it is (ii) or (iii) the Editor suspends output until <xon> (^Q) is typed.

In earlier versions of the Editor, it was possible to abort the display by giving an edit command. Control-C (^C) and REENTER will achieve this effect safely and return the Editor to edit state.

DISPLAY may be abbreviated to DIS

8.2 TRANSLATION FROM 026 TO 029 CHARACTERS

TRANSLATE +n

TRANSLATE n means translate n lines converting the five 026 characters that fall within the FORTRAN subset of characters to their 029 equivalents.

i.e. @ becomes ,
     % becomes ( 0-8-4
     < becomes ) 12-8-4
     & becomes + 12
     # becomes = 8-3

This is used if a FORTRAN program has been punched with a mixture of 029 and 026 codes and the deck has then been read with a MODE.ASCII switch.

TRANSLATE may be abbreviated to TR

8.3 FORTRAN DIRECT ACCESS COMPATIBILITY

/DIRECT:n

This switch on an output filespec allows the Editor to create data files that will be compatible with Fortran direct access filing specifications. The 'n' is the RECORD SIZE used in the Fortran OPEN statement. Two characters are added for the <cr><lf> and lines are padded out with nulls to the exact word boundary. For example, 5-word lines would be created if 'n' were set at 20. If a user's line is too long then an error message is given, the long line is printed and filing is stopped. The user may edit it if possible and try again, or use a larger value of n.

/DIRECT:n applies only to the output file to which it was specified, e.g... FILE filename/DIRECT:72 or PUT n filename/DIRECT:126

/DIRECT may be abbreviated to /DI
8.4 BASIC PROGRAMS AND LINE-NUMBERED FILES

BASIC and certain line editors create files with special line sequence numbers on each line. Such files may be edited leaving the line numbers intact for BASIC programs, but removing them for all other files. Two switches are available in case it is necessary to override the default cases.

/DELSEQ
This is the default for all files except BASIC programs. Line numbers are deleted.

/NODELSEQ
The default for BASIC files (extension .BAS), this switch leaves line sequence numbers on any lines that have them. The structure of the line is not preserved, relying on the ability of BASIC to restructure the sequence number.

/DELSEQ and /NODELSEQ may be abbreviated to /DE and /NOD respectively.

8.5 PROTECTION AND PRIVACY OF FILES

Files created by the Editor are given protection from access by other users depending on
(a) the protection of a pre-existing file of that name, or
(b) the protection of the file from which it was derived, or
(c) the installation default protection.
In addition, no .BAK file is created with so much protection that the owner cannot delete it without changing its protection first. The owner may edit files he is allowed to supersede or update. Other users will not be successful unless the owner has allowed renaming of the file.

8.6 EDITING OTHER PROGRAMMERS' FILES

Successful editing depends on the protection of the file concerned or of the directory if the file does not exist.

Ersatz devices are directories referred to by device-like names e.g. SYS:, NEW:, HLP: and LIB:. A library is a directory declared as such at LOGIN or set by program (e.g. SETSRC). A library is regarded as a read-only device when accessed implicitly. SYS: and NEW: may be given the status of libraries at LOGIN. The rule followed by the Editor in determining library status is, "if the path taken to find the file differs from the specified path or the default path for the device, the file is treated as if it was found in a library". This is extended to cover sub-file directories also.

The action of the Editor is best illustrated by examples. Suppose a person logged in on [100,100], specifying [100,5] as a library and requesting that NEW: and SYS: be searched for files not found on
[100,100] or [100,5].

LOGIN 100,100 /LIB:[100,5] /NEW /SYS

Suppose that the following files existed with a low enough protection; A[100,100], B[100,5], SYS.C and NEW:D.

Referring to the files directly - "CREATE A", "CREATE LIB.B", "CREATE B[100,5]", "CREATE SYS:C", "CREATE C[1,4]", "CREATE NEW:D" and "CREATE D[1,5]" all supersede the existing file where protection allows it. "EDIT" in each of these cases would create a new file on the specified directory with the original becoming ?.BAK.

Referring to the files implicitly - "CREATE B", "CREATE C" and "CREATE D" all give a warning that such a file was found but create the new version in the default path [100,100]. "CREATE SYS:D" warns that NEW:D exists but creates SYS:D. Corresponding "EDIT" commands warn where the file was found, read it, and create the new file leaving the original. No .BAK file is created.

8.7 CONTROLLING EDITOR SIZE FOR EFFICIENCY

SET MAXCOR n

The size of the Editor's data segment may be restricted by use of the /MAXCOR switch on the EDIT command or by the SET MAXCOR command. This value may be specified as n words, nP or nK. Any value outside the prevailing system limits e.g., "**" is adjusted to conform. The default value allows five pages of the file being edited to reside in core. This has been chosen to be efficient for most editing, but the optimum setting varies with the type of editing activity. A value as low as 5K may be the most suitable if only a few lines are accessed at any time, the other extreme reducing disk accesses for jobs which commonly search over the whole file. The Editor has a limit of 50 in-core pages and will not use more memory than necessary.

SET MAXCOR with no argument gives some details of the current setting and core usage.

example:

.EDIT SAMPLE.FOR/MAXCOR.1<cr>  [will use the minimum allowed]
C THIS IS A SAMPLE PROGRAM
[EDITMCR 1 in-core page, 6 MAXCOR with 2K low core allows 3 pages]
*SET MAXM<cr> [change MAXCOR]
[see what changed]
[EDITMCR 1 in-core pages, 20 MAXCOR with 2K low core allows 50 pages]
*

SET MAXCOR may be abbreviated to SET M
8.8 CHANGING THE DEFAULTS FOR THE SET COMMANDS

The default values for the various SET commands were originally chosen so as not to change the behaviour established by earlier versions of QEDIT. It is often convenient to take advantage of some of these features without having to give the SET command. For instance, if you prefer either case matching in searches, the SET ULCASE command provides this. Alternatively "EDIT filespec/ULCASE" may be used with the advantage that for subsequent EDIT commands within the same LOGIN session you need not give either the filename or the switches on an EDIT command.

For more permanent changing of the default settings, you may make use of SWITCH.INI. SWITCH.INI is a file that you can create with a line for any of the system programs that set their defaults in this way.

example:

```
.CREAE SWITCH.INI<cr>
Input:
LOGIN /SETTTY/GAG:0/COST.S20./DEFFRO.017<cr>
RUNOFF /CRETURN/AUTOP<cr>
QUEUE /PRIORITY:4/NOHEAD<cr>
QEDIT /LOG/ULCASE/2400/RUN:SYS:RUNOFF/VERB:FIRST<cr>
FUR /DECIDE<cr>
<cr>
*FILE<cr>
[EDIFIL Filed : SWITCH.INI]
```
CHAPTER 9

ILLUSTRATED EXAMPLE

A complete example will now be given which illustrates a number of the facilities outlined in this manual. A FORTRAN program will be written to calculate the area of a circle given the value of its diameter.

```
.CREAFRTRN.FOR/LOG.SAFETY.EDI<cr>
Input: [input state signalled]
C<tab> >PROGRAM TO CALCULATE AREA OF CIRCLE<cr>
C<tab> >WRITTEN BY J. SMITH FEB 1970<cr>
10<tab>READ (5, 20) DIAM<cr>
20<tab>FORMAT (F10.3)<cr>
C<tab> >TEST FOR END OF JOB (DIAM=0)<cr>
<tab> >IF (DIAM.EQ.0) STOP<cr>
C<tab> >CALCULATE AREA AND PRINT RESULT<cr>
<tab> >AREA=3.1416*(DIAM**.5)**2<cr>
<tab> >WRITE (6, 30) DIAM, AREA<cr>
30<tab>FORMAT (' DIAM', F10.3, ' AREA', F10.3//)<cr>
C<tab> >RETURN TO READ MORE DATA<cr>
<tab> >GO TO 10<cr>
<tab> >END<cr>
<cr>
*FILE<cr>
[null line]
[edit state signalled]
[this file has now been kept with the same name given in the CREATE command]
[return control to the Monitor]
```

The program can now be compiled and run in the following manner:

```
.EXECUTE FRTRN.FOR<cr>
FORTRAN: FRTRN.FOR
LINK: Loading
[LNXCT FRTRN Execution]
10.0<cr>
DIAM 10.000 AREA 78.540

5.0<cr>
DIAM 5.000 AREA 19.635
```
The program will now be modified in order that it may produce both the perimeter and the area for any given diameter. This could be performed in the following way. (The edit will be performed in verify mode so that the example can be followed easily).

```
0.0<cr>
END OF EXECUTION
CPU TIME: 0.12  ELAPSED TIME: 22.44
EXIT
-

.C PROGRAM TO CALCULATE AREA OF CIRCLE
[the filespec and switches from the create command will have been remembered]

.C /AREA/PERIMETER AND AREA/<cr>
[first line of file printed]

.C PROGRAM TO CALCULATE PERIMETER AND AREA OF CIRCLE

.L 3 /<cr>
[starts locating from the next line]

.C CALCULATE AREA AND PRINT RESULT
[locates the third comment line]

.C. /AREA/PERIMETER AND AREA/<cr>
.C /RESULT/RESULTS/<cr>
.C CALCULATE PERIMETER AND AREA AND PRINT RESULTS

.SAVE<cr>
[EDICLF C1osed log file: SAFETY.EDI] [save file as precautionary
[EDITSAV Saved: DSKD:FRTRN.FOR] measure - FRTRN.FOR assumed]
[EDILFR Log file restarted]

.C CALCULATE PERIMETER AND AREA AND PRINT RESULTS

.I<cr>
[insert two lines]

.<cr>
[null line]

<&tab> R A D = (D I A M * .5)<cr>
[transfer pointer to next line]

<&tab> P E R M = 2 * 3.1416 * R A D<cr>

<&tab> A R E A = 3.1416 * (D I A M * .5)**2

<&tab> (D I A M * .5)/R A D<cr>

<&tab> A R E A = 3.1416 * R A D**2

<&tab> AREA/PERM, AREA/<cr>

<&tab> WRITE(6, 30) DIAM, PERM, AREA
[transfer pointer to next line suppressing printing]

<&tab> 30 FORMAT ( 'DIAM', 1F10.3, 'AREA', 1F10.3 )

<&tab> 30 FORMAT ( 'DIAM', 1F10.3, 'PERM', 1F10.3, 'AREA', <cr>

<&tab> 1F10.3 )<cr>
[replace line]
```

The entire file will now look like this:
ILLUSTRATED EXAMPLE

*T.;P *<cr>  [multiple commands on a line]
C PROGRAM TO CALCULATE PERIMETER AND AREA OF CIRCLE
C WRITTEN BY J. SMITH FEB 1970
10 READ (5,20) DIAM
20 FORMAT (F10.3)
C TEST FOR END OF JOB (DIAM=0)
   IF (DIAM.EQ.0.0) STOP
C CALCULATE PERIMETER AND AREA AND PRINT RESULTS
   RAD=(DIAM*.5)
   PERM=3.1416*RAD*2
   AREA=3.1416*RAD**2
   WRITE(6,30) DIAM, PERM, AREA
30 FORMAT (' DIAM', F10.3, ' PERM', F10.3, ' AREA',
             1F10.3//)
C RETURN TO READ MORE DATA
   GO TO 10
END
***END
*EXEC<cr>
[EDITIL Filed : DSKD:FRTRN.FOR]
[EDIACLF Closed log file: SAFETY.EDI]

Compilation and execution of the program now produces:

FORTRAN: FRTRN.FOR
LINK: Loading
[LNKXCT FRTRN Execution]
10.0<cr>
DIAM 10.000 PERM 31.416 AREA 78.540

5.0<cr>
DIAM 5.000 PERM 15.708 AREA 19.635

0.0<cr>

END OF EXECUTION
CPU TIME: 0.18 ELAPSED TIME 9.46
EXIT

<tr>
<td></td>
<td></td>
<td>Changes every occurrence of string1 in a line to string2. Starts at current line for +n lines.</td>
</tr>
<tr>
<td>APPEND</td>
<td>AP</td>
<td>APPEND +n /string/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Inserts the string enclosed in any delimiters at the end of the line. Starts at current line for +n lines.</td>
</tr>
<tr>
<td>BACK</td>
<td>BA</td>
<td>BACK +n</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Move line pointer back to its position before the last command plus or minus n lines. BACK does not affect REPEATING.</td>
</tr>
<tr>
<td>BOTTOM</td>
<td>B</td>
<td>BOTTOM</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Moves line pointer to last line in file.</td>
</tr>
<tr>
<td>CHANGE</td>
<td>C</td>
<td>CHANGE +n /string1/string2/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Changes the first occurrence of string1 in a line to string2. Starts at current line for +n lines.</td>
</tr>
<tr>
<td>CONCAT</td>
<td>CO</td>
<td>CONCAT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>CONCAT -</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Concatenates the current line and the next line in either direction.</td>
</tr>
<tr>
<td>DELETE</td>
<td>DEL</td>
<td>DELETE +n</td>
</tr>
<tr>
<td></td>
<td></td>
<td>DELETE –/string/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Deletes +n lines starting at current line.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>or Deletes lines up to (but excluding) line</td>
</tr>
</tbody>
</table>

B-1
containing the string. Starts at current line.

DINSERT  DIN  DINSERT +n
            DINSERT +/string/
Behaves as with Delete, but moves back up to the
line before the deletion and places the Editor
into input state to accept further data.

DISPLAY  DIS  DISPLAY +n
            DISPLAY +/string/
Used to display data upon display terminals.
Same as PRINT except that Editor waits when the
bottom of a page is reached and erases the
screen and starts a new page when signalled.
Type `Q <XON>` to continue displaying.

EXECUTE  E  EXECUTE filespec
Saves the current file as filespec, then
executes the last COMPIL/LOAD/EXEC/DEBUG
command.

FILE  F  FILE filespec
Saves the file and returns control to the
monitor.

GET  G  GET filespec
Inserts file into the incore file. Insertion
takes place after the current line.

H  H  H
Lists the commands and switches with no
explanation.

HELP  HE  HELP
Types a full help text.

INSERT  I  INSERT line
            INSERT
Inserts one or more lines. Insertion takes
place after the current line.

JOBBALANCE  JOBB  JOBBALANCE
Types out the current job cost balance.

JOBTIME  JOBT  JOBTIME
Types out the total CPU time since login.

LABEL  LA  LABEL +/label+n
Searches for a label (the label must start in
column 1) up or down the file plus or minus a
number of lines. No delimiters are used in the
LABEL command.

B-2
<table>
<thead>
<tr>
<th>command</th>
<th>abbr</th>
<th>general form of command</th>
</tr>
</thead>
<tbody>
<tr>
<td>LINE LI</td>
<td>LINE n</td>
<td>Locates the line number n and moves the pointer to that line. If no argument is given, the current line number and length including &lt;cr&gt;&lt;lf&gt; will be typed out.</td>
</tr>
<tr>
<td>LOCATE L</td>
<td>LOCATE +n /string/</td>
<td>Locates the line containing the nth occurrence of the string. Search begins at the next line, up or down the file.</td>
</tr>
<tr>
<td>MACRO M</td>
<td>MACRO filespec</td>
<td>Create a file of commands or any text without disturbing the current file.</td>
</tr>
<tr>
<td>NEXT N</td>
<td>NEXT +n</td>
<td>Moves the line pointer down +n lines.</td>
</tr>
<tr>
<td>OPRINT O</td>
<td>OPRINT +n</td>
<td>Types out +n lines starting at current line, in octal format.</td>
</tr>
<tr>
<td>PERFORM PER</td>
<td>PERFORM n filespec</td>
<td>Perform the commands from the specified file n times.</td>
</tr>
<tr>
<td>PREPEND PRE</td>
<td>PREPEND +n /string/</td>
<td>Inserts the string enclosed in any delimiters at the start of the line. Starts on current line for +n lines.</td>
</tr>
<tr>
<td>PRINT P</td>
<td>PRINT +n /string/</td>
<td>Types out +n lines starting at current line. or Types out all lines up to (and including) the line containing the string.</td>
</tr>
<tr>
<td>PUT PUT</td>
<td>PUT +n filespec</td>
<td>Puts all lines up to (but excluding) line containing string, into a file. Starts at current line.</td>
</tr>
<tr>
<td>PUTDEL PUTD</td>
<td>PUTDEL +n filespec</td>
<td>Same as PUT except that it deletes the corresponding section from the incore file.</td>
</tr>
<tr>
<td>QUIT Q</td>
<td>QUIT</td>
<td>Returns control to the monitor without keeping the current file. Closes the log file.</td>
</tr>
<tr>
<td>command</td>
<td>abbr</td>
<td>general form of command</td>
</tr>
<tr>
<td>---------</td>
<td>------</td>
<td>-------------------------</td>
</tr>
<tr>
<td><strong>REPEAT</strong></td>
<td>RR</td>
<td>REPEAT n</td>

<tr>
<td><strong>REPLACE</strong></td>
<td>R</td>
<td>REPLACE line</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Replaces current line with the one typed in.</td>
</tr>
<tr>
<td><strong>RUN</strong></td>
<td>RU</td>
<td>RUN &lt;filespec&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Saves the current file as &lt;filespec&gt;, then runs the program specified in the last SET RUN command or /RUN switch.</td>
</tr>
<tr>
<td><strong>SAVE</strong></td>
<td>SA</td>
<td>SAVE &lt;filespec&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Saves the file without returning control to the monitor. Pointer remains at the current line. Closes and reopens the log file.</td>
</tr>
<tr>
<td><strong>SEARCH</strong></td>
<td>S</td>
<td>SEARCH ±n /string/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Searches for line containing string. Starts searching at next line for ±n lines.</td>
</tr>
<tr>
<td><strong>SPLIT</strong></td>
<td>SP</td>
<td>SPLIT ±/string/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Split the line after the string or the n’th character placing the rest of the line as a new line after (before) the current line.</td>
</tr>
<tr>
<td><strong>STATEMENT</strong></td>
<td>ST</td>
<td>STATEMENT ±label±n</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Searches for Fortran type statements (labels anywhere in the first 5 columns of the line with leading or trailing blanks) plus or minus ±n lines. No delimiters are required.</td>
</tr>
<tr>
<td><strong>TOP</strong></td>
<td>T</td>
<td>TOP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Moves pointer to dummy top line.</td>
</tr>
<tr>
<td><strong>TRANSLATE</strong></td>
<td>TR</td>
<td>TRANSLATE ±n</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Translates ±n lines from 025 to 029 characters.</td>
</tr>
<tr>
<td><strong>UP</strong></td>
<td>U</td>
<td>UP ±n</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Moves pointer up ±n lines.</td>
</tr>
</tbody>
</table>
B.2 SET COMMANDS AND EDIT SWITCHES

EDIT switches and file switches are given after the CREATE or EDIT
filespec. EDIT switches may be included in SWITCH.INI in a QEDIT line
if you wish to change the default settings permanently. See Section
8.8 for a SWITCH.INI example.

<table>
<thead>
<tr>
<th>command</th>
<th>abbr</th>
<th>command form</th>
<th>switch form</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET BRIEF</td>
<td>SET</td>
<td>SET BRIEF</td>
<td>/BRIEF suppress the usual typeout unless temporarily overridden by &quot;.&quot; after the command.</td>
</tr>
<tr>
<td>SET VERIFY</td>
<td>SET</td>
<td>SET VERIFY</td>
<td>/VERIFY typeout current line unless temporarily suppressed by &quot;.&quot; after the command (default).</td>
</tr>
<tr>
<td>SET NOBRIEF</td>
<td>SET</td>
<td>SET NOBRIEF</td>
<td>/NOBRIEF same as SET VERIFY.</td>
</tr>
<tr>
<td>SET NOVERIFY</td>
<td>SET</td>
<td>SET NOVERIFY</td>
<td>/NOVERIFY same as SET BRIEF.</td>
</tr>
<tr>
<td>SET FLAG</td>
<td>SET</td>
<td>SET FLAG</td>
<td>/FLAG cause flagging of control characters and lower case characters printed. &quot;PRINT.&quot; overrides &quot;SET FLAG&quot;.</td>
</tr>
<tr>
<td>SET NOFLAG</td>
<td>SET</td>
<td>SET NOFLAG</td>
<td>/NOFLAG turn off flagging (default). &quot;PRINT.&quot; overrides &quot;SET NOFLAG&quot;.</td>
</tr>
<tr>
<td>SET LOG</td>
<td>SET</td>
<td>SET LOG</td>
<td>/LOG:filespec write all terminal input to a log file. Used to recover after a system crash or user error.</td>
</tr>
<tr>
<td>SET NOLOG</td>
<td>SET</td>
<td>SET NOLOG</td>
<td>/NOLOG close any open log file. The file may later be PERFORMed.</td>
</tr>
<tr>
<td>SET MAXCOR</td>
<td>SET</td>
<td>SET MAXCOR n</td>
<td>/MAXCOR:n expand the low segment limit to n Kwords. If n=0 give some core statistics.</td>
</tr>
<tr>
<td>SET PAGE</td>
<td>SET</td>
<td>SET PAGE n</td>
<td>/PAGE:n set page mode and page size to n lines for display terminals. By default page mode is unchanged.</td>
</tr>
</tbody>
</table>
command  abbr  command form  switch form  MNT-6/ed6
16Mar82

SET NOPAGE  SET NOP  SET NOPAGE  /NOPAGE
clear page mode. By default page mode is unchanged.

SET ULCASE  SET U  SET ULCASE  /ULCASE
allow upper/lower case to match lower/upper case in search strings.

SET NOULC  SET NOU  SET NOULC  /NOULC
enforce exact case matching in searches (default).

SET VERBOSITY  SET VERB  SET VERBOSITY x  /VERBOSITY:x
where x is one of NONE, LOW, FIRST, STANDARD, CONTIN, PRECON, FIRCON, HIGH - applies to most error and informative messages.

SET RUN  SET R  SET RUN filespec  /RUN:filespec
set a program to run on a RUN command.

SET RUNOFFSET  SET RUNO  SET RUNOFFSET n  /RUNOFFSET:n
offset from the normal start address of the program to be run.

B.3 FILE SWITCHES

switch  abbr  general form of switch

/DIRECT  /DI  /DIRECT:n
Output as Fortran direct access, record size n.

/HELP  /H  /HELP:TEXT
/HELP:SWITCH
full help text or switches and commands.

/DESEQ  /DE  /DESEQ
delete line sequence numbers from input file.

/NODESEQ  /NOD  /NODESEQ
leave line numbers on input file, default for BASIC.

APPENDIX D
INFORMATIVE MESSAGES

D.1 EDITING MESSAGES

Messages enclosed in brackets are informative, those preceded by % are warnings, and those preceded by ? indicate serious errors.

%EDIAMB Ambiguous command
abbreviation was non-unique. Type H for list of commands.
[EDICLP Closed log file: filespec]
response from SET NOLOG, SET LOG, QUIT, FILE, etc. or a fatal error.
[EDICWF Closed macro command file: filespec]
end of MACRO command input state, back to edit state.
?EDIDLT Direct access line too big - FILEing discontinued
edit the line or FILE with a greater /DIRECT:value.
%EDIDPF Error deleting paging file
the temporary work file could not be deleted due to some system fault.
%EDIFFI Found file in [path]
[CREATE] a file of this name exists in the library path or
[EDIT] the file was read from a library or ersatz device.
No backup will be provided.
[EDIFIL Filed : filespec]
filed successfully.
%EDIIND Invalid delimiter: c
illegal delimiters include "+", ",", ".", ";", ",#", ",*" and digits.
%EDIIVS Illegal value: *
[LOCATE * or PERFORM *] see Section 3.1.3 or Section 6.3.
[EDILDL Lines deleted: n]
for a deletion limited by the occurrence of a string.
[EDILFR Log file restarted]
after a SAVE the log file is restarted at the beginning.
[EDILND Line numbers deleted]
input file had special line sequence numbers used by BASIC
and some editors. /NODELSEQ prevents such deletion.
%EDILTL No change - line too long
lines may not be changed to exceed the limit of 300

D-1
INFORMATIVE MESSAGES

characters.

[EDIMCR]  n in-core pages, n MAXCOR with nK low core allows n pages
information given in response to SET MAXCOR 0.

%EDINAC  Not a command - type "H" or "HELP"
"H" gives a list of commands, "HELP" gives an explanation.

%EDINAD  Not a digit: c
LABEL nnn+d, or STATEMENT nnn+d, where d is not a digit.

?EDINFS  No file specified
FILE, SAVE etc. commands with no file specified and no
default available.

%EDINJT  No job cost tables in monitor
only the University of Queensland monitor has the accounting
features required.

%EDINLC  No label in command
[FUNCTION or STATEMENT] an unlimited label is required.

[EDINOC]  No change
string to be changed is not in the current line. See also
the SET ULCASE command.

?EDINPU  No PATH UUO
needs a modern version of the monitor.

%EDINSC  No string in command
CHANGE, ALLCHANGE, SEARCH and LOCATE require a delimited
string.

%EDINSL  No such line: n
[LINE n] n is negative or greater than the number of lines
in the file.

%EDINTF  Nothing to file
[PUT or PUTDEL] The current line is the dummy end line.

%EDINTR  Nothing to repeat
[REPEAT] No preceding repeatable commands. SET, SAVE, BACK
and REPEAT are not repeatable. INSERT DINSERT, PERFORM and
MACRO leave nothing to repeat.

%EDIPAB  Perform aborted
For safety even warnings abort PERFORMs.

?EDIRPF  Error reading paging file
a file system error. Recoverable only by performing the log
file, if any.

[EDISAV  Saved : filespec]
successful SAVE.

%EDISEF  Superseding existing file
[CREATE] the existing file will be lost if no file name is
given on the FILE command.

%EDISNF  Not found
SEARCH over n lines did not find the specified string.

%EDITMP  Too many nested PERFORM commands
PERFORMs may be nested to a depth of 5. A PERFORM which
performs itself will give this.

?EDIWPF  Error writing paging file
a file system error. Recoverable only by performing the log
file.

%EDIWNF  Writing a null file
FILE, SAVE, RUN or EXECUTE with no lines to write creates an
empty file.
% Minimum abbreviation for DELETE is DEL
   a safety feature to prevent accidental deletion of lines.

</table>
APPENDIX E

GENERAL COMMENTS

E.1 CONTROL-O

Typeout from the program can be stopped at any time by typing `O (depress CTRL key while striking O). This suppresses all printout from the program but will not suppress the '*' which indicates that the program is still in edit state. It is therefore possible to ascertain when the Editor is ready to receive additional data.

E.2 CONTROL-U AND RUBOUT

Typing `U (depress CTRL key while striking U) can be used to erase any characters the user has typed in - back to the last break character. Break characters are <cr>, <lf>, <bel>, <vt>, <ff>, <esc> and `Z.

example:

*RPLACE `U
REPLACE <tab>LP=7<cr>
*

If only a few characters are incorrect and need to be retyped, these can be erased by typing the RUBOUT or DEL key until the appropriate number of characters has been removed. Those characters that have been rubbed out are bounded by '\'.

example:

*REPLACE\ECA\LACE <tab>LP=7<cr>
*

E.3 CONTROL-R

After a line has been corrected using rubout, typing Control-R will retype the corrected line.
example:

*REPACE\ECA\LACE"R
REPLACE<tab>LP=7<cr>
*

E.4 CONTROL-S AND CONTROL-Q

When page mode is set either by the monitor command SET TTY PAGE or by
the Editor command SET PAGE, typeout can be suspended by typing 'S
<XOFF>. Output is resumed when 'Q <XON> is typed.

E.5 TREATMENT OF TAB CHARACTER BY COMPILERS

E.5.1 FORTRAN Compiler

It is worth noting the special treatment by the FORTRAN compiler of
the tab character. The first tab character of a FORTRAN source
statement, if it occurs before the 6th character of the line, will
advance to column 7 if followed by a non-numeric character, or to
column 6 if followed by a numeric character. Subsequent tab
characters will index to the next multiple of 8 characters as normal.
This feature enables one to create normal FORTRAN statements by
preceding the body of the statement by a tab. A continuation of the
statement is likewise created by a tab followed by a numeric
continuation character. The feature is designed to simplify the
creation of FORTRAN source programs and it must be emphasized that it
is a property of the FORTRAN compiler, not the Editor which does not
in any way differentiate between the first and subsequent tabs, or in
fact between any other logical characters.

E.5.2 COBOL Compiler

The format of a COBOL program is organized so that division names,
paragraph names etc. begin at column 1 (if there are no program
sequence numbers) or column 8 (if the program has sequence numbers).
This is referred to as the A margin.

The body of the program appears in the B margin, 4 spaces after the A
margin. However, if a <tab> is typed anywhere within the A margin
area, the compiler will treat the remaining data on the line as
starting from the B margin, saving the programmer the labourious
necessity of typing the individual spaces required to format the
program correctly.
